

(b) Priority and explicit energy accounting

$$R_n = V w_n d_n \rho_n - Q_n c_n, \quad d_n = \min\{A_n + 1, A^{\max}\} - 1$$

$$\rho_n = h_n q_{n\mathrm{L}} + (1 - h_n) q_{n\mathrm{N}} \quad \text{(feedback mode)}$$

Queue envelope: $0 \le Q_n \le H_n$; window excess $\le \tau H_n$

Finite radio reserve: admit only $\tau c_n \le B_n$
